

iLook Scanner Automatic Online Glass Quality Control

The iLook scanner system measures glass distortions for roller wave and edge lift. In order for the operator to make fast decisions to correct the Glaston furnace settings.

The iLook measurements are automatically logged into a data library, allowing glass quality and anisotropy reporting and traceability. Thus allowing even more specific project quality standards

The iLook Scanner automatically measures and scans glass for distortion and anisotropy.

- Intelligent and accurate online measuring system to comply with the increased optical quality demands of toughened and heat strengthened laminated.
- Ensures 100% compliance with standards for roller wave and edge lift to BSEN12150 and BSEN1863
- Offers the opportunity to comply with the most stringent glass façade specifications for roller wave and edge lift.
